

Figure S1. EPC-Exos induced S-phase entry. (A) The altered expression of transcription of key cell cycle regulators in Erk1/2 signaling was confirmed by qRT-PCR analyses. (B) Endothelial cells were treated with EPC-Exos for 24 hours, and PI staining was used to detect the percentage of S-phase cells by flow cytometry. (* $P < 0.05$ compared with the control and Exos+U0126 groups)
