54 **Supplementary Figure 7. Conceptual illustration on the role of CAP in**
55 **triggering mitophagy via EGFR (Tyr1068) phosphorylation induced**
56 **mitochondria fission. (A)** Both IBRV infection and CAP exposure could enhance
57 cellular ROS level, and their synergistic effect could substantially increase
58 EGFR(Tyr1068) phosphorylation that is translocated into the surrounding region of
59 mitochondria and interacts with Drp1(Ser616). Enhanced level of phosphorylated
60 EGFR(Tyr1086) is associated with elevated Drp1(Ser616), the physical interaction of
61 which leads to boosted mitochondria fission. Halted cell growth as a result of
62 mitophagy fosters a favorable environment for virus propagation, and the effect
63 increases with CAP treatment duration before cellular ROS level reaches the apoptotic
64 threshold. **(B)** Cells first undergo slightly decreased and later dramatically increased
65 G₀/G₁ cell cycle arrest, and slightly enhanced and later substantially reduced G₂/M cell
66 cycle stage with the increase of H₂O₂ concentration.
