

**Supplementary Figure S1. Confirmation of the overexpression of FLAG-hnRNP UL1 in HEK UL1 OE cells.** Western blotting followed by immunostaining using an anti-FLAG antibody. HEK WT cells were used as controls. Actin was used as a loading control.

**Supplementary Figure S2. Quality of isolated nucleoli from HEK UL1 KO and HEK WT cells.** An anti-fibrillarin antibody (FIB) was used to detect fibrillarin, a marker of the NO fraction, while anti-actin was used to detect actin, a marker of the CN fraction.

**Supplementary Figure S3. Confirmation of hnRNP UL1 knockout in the HEK293T cell line.** For PCR, primers flanking the fragment of the sequence deleted from the *hnRNPU1* gene were used. After electrophoresis, the expected product with a length of 7500 nucleotides was visible only in HEK WT cells. In HEK UL1 KO cells, a product of 3600 nucleotides was visible after removing part of the *hnRNPU1* gene sequence. \*- nonspecific products.

**Supplementary Table S1. hnRNP UL1 is involved in the expression of rDNA genes.** rDNA genes representing 5S, 5.8S, 18S, 28S and 45S in both fractions. The fold change values indicate statistically significant ( $p$  value $<0.05$ ) changes in ribosomal gene expression in HEK UL1 KO cells relative to HEK WT cells.

**Supplementary Figure S4. Regulation of the expression of rDNA genes and ribosomal protein genes by hnRNP UL1.** (A-C) rDNA gene expression was analyzed in (A) WCs and in (B) CN and (C) NO fractions isolated from HEK WT and HEK UL1 KO cells. The error bars represent the SDs of three biological replicates. The p values were calculated using Student's t test, and the statistical significance is represented as follows: \*P ≤ 0.05; \*\*P ≤ 0.01; \*\*\*P ≤ 0.001.

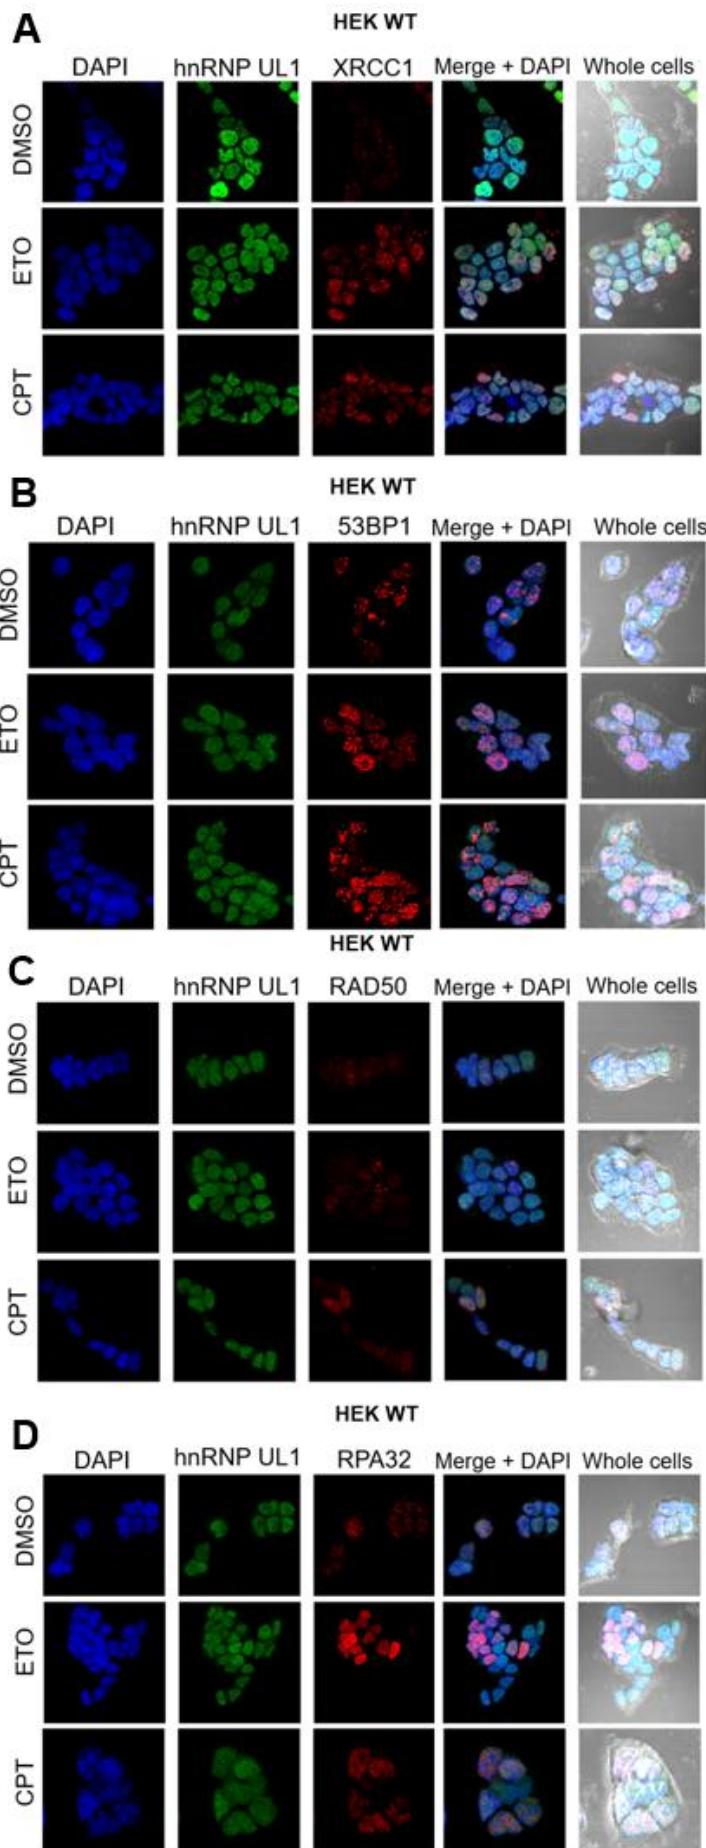

**Supplementary Figure S5. Levels of ribosomal proteins (RPS6 and RPS15) and the nucleolar marker fibrillarin (FIB) in HEK UL1 KO cells compared to HEK WT cells.** Western blotting and immunostaining were performed using anti-RPS6, anti-RPS15, and anti-FIB antibodies. Actin was used as a loading control. The experiment was performed in three biological replicates.

**Supplementary Figure S6. Polysome profiling in HEK UL1 KO cells compared to HEK WT cells.** The absorbance profiles of polysomes isolated from HEK WT (red line) and HEK UL1 KO (black line) cells were overlapped.

**Supplementary Figure S7. Examination of  $\gamma$ H2A.X levels in HEK UL1 KO cells relative to HEK WT cells.** Cells were stained using anti- $\gamma$ H2A.X and anti-hnRNP UL1 antibodies. DAPI was used for nuclear staining. Scale bars: 20  $\mu$ m.

**Supplementary Figure S8. Colocalization of hnRNP UL1 with known DDR markers in HEK WT cells after induced DNA damage.** DNA damage in HEK WT cells was induced by ETO and CPT. (A) Staining using anti-hnRNP UL1 and anti-XRCC1 antibodies. (B) Staining using anti-hnRNP UL1 and anti-53BP1 antibodies. (C) Staining using anti-hnRNP UL1 and anti-RAD50 antibodies. (D) Staining using anti-hnRNP UL1 and anti-RPA32 antibodies. Cells treated with DMSO were used as negative controls. DAPI was used for nuclear staining. Scale bars: 20  $\mu$ m.
