Supplemental figures

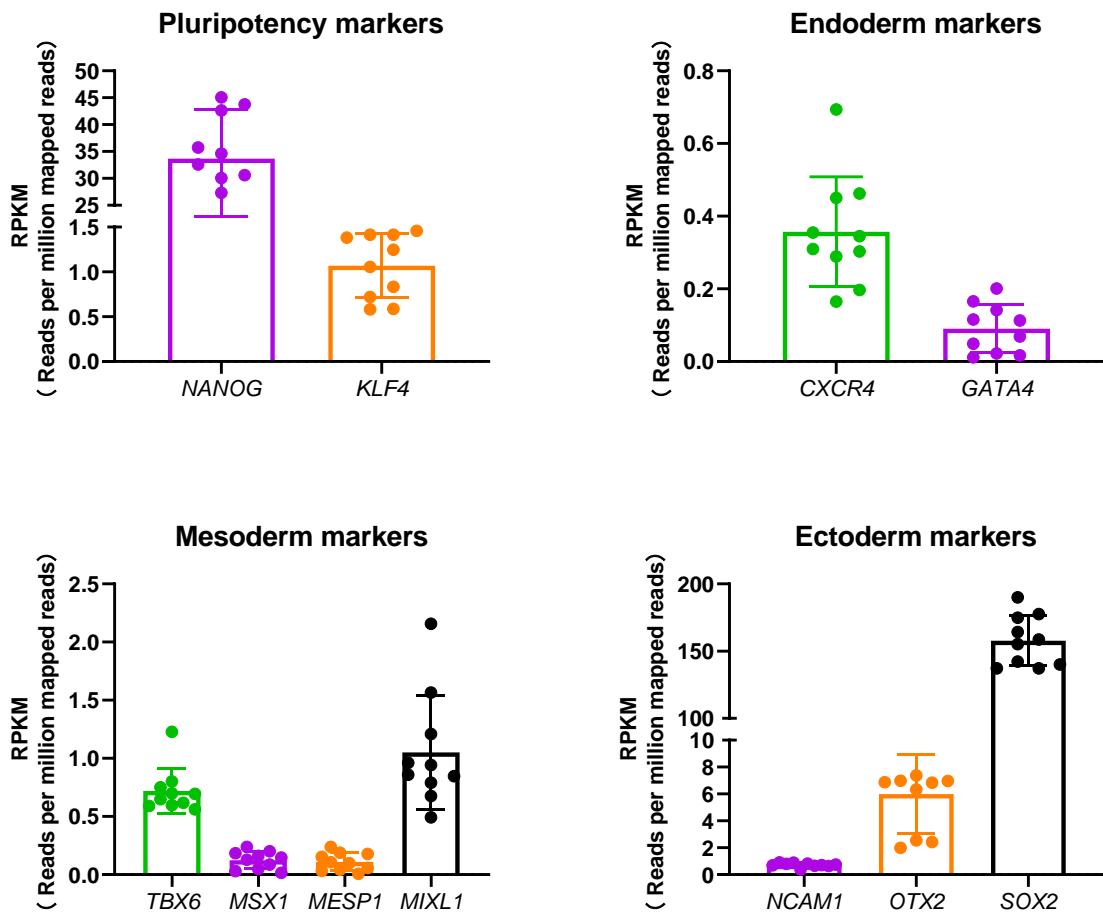

NANOG

Supplementary Figure 1: Flow cytometry analysis of Nanog-positive cells.

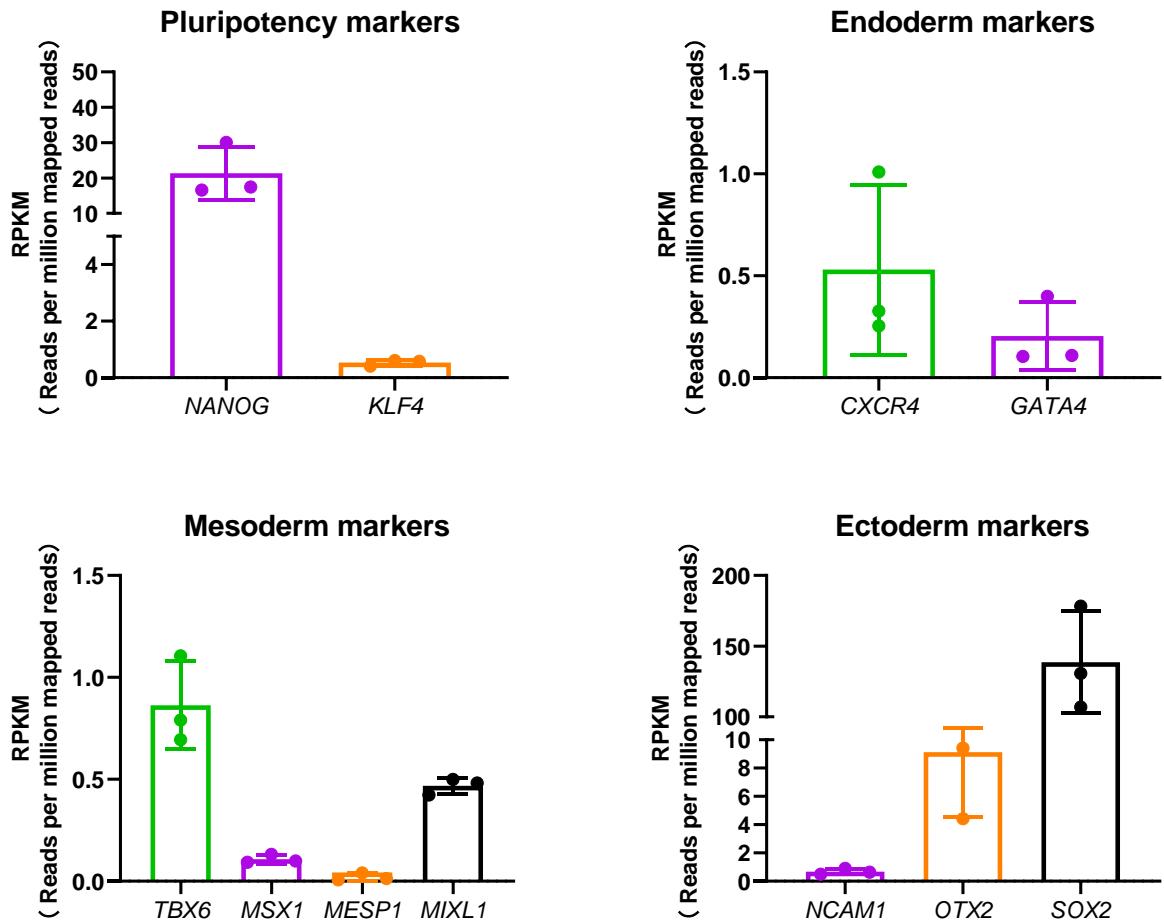

Supplementary Figure 2: Phase-contrast images in control and Alpers' iPSCs. Scale bar is 100 μm .

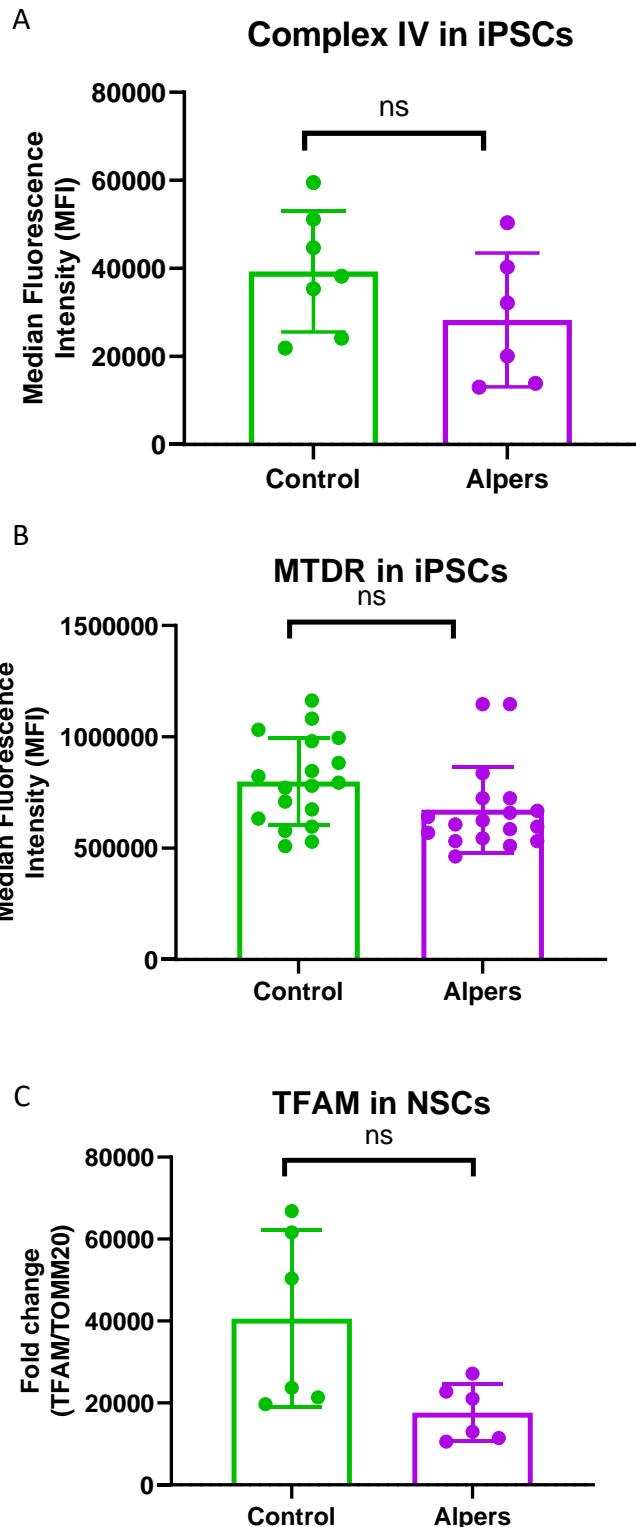

Supplementary Figure 3: Gene expression of the pluripotent, endoderm, mesoderm and ectoderm makers in control iPSCs.

The numbers of clones and replications in each experiment were listed in Table S 15.

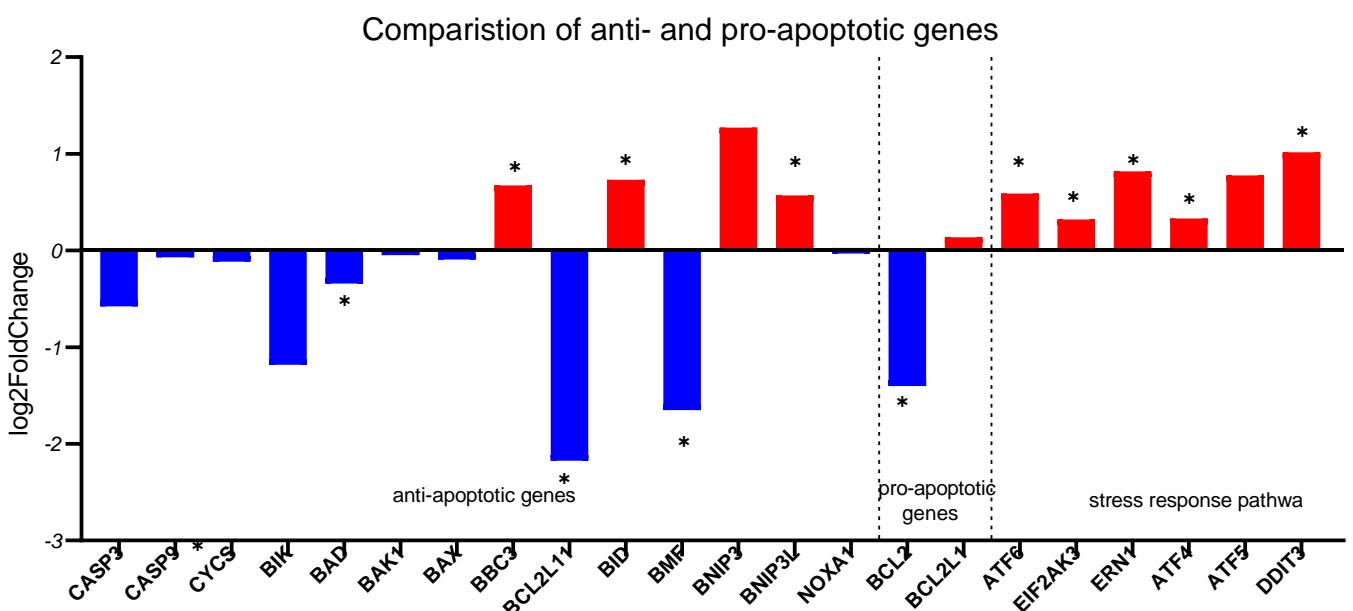

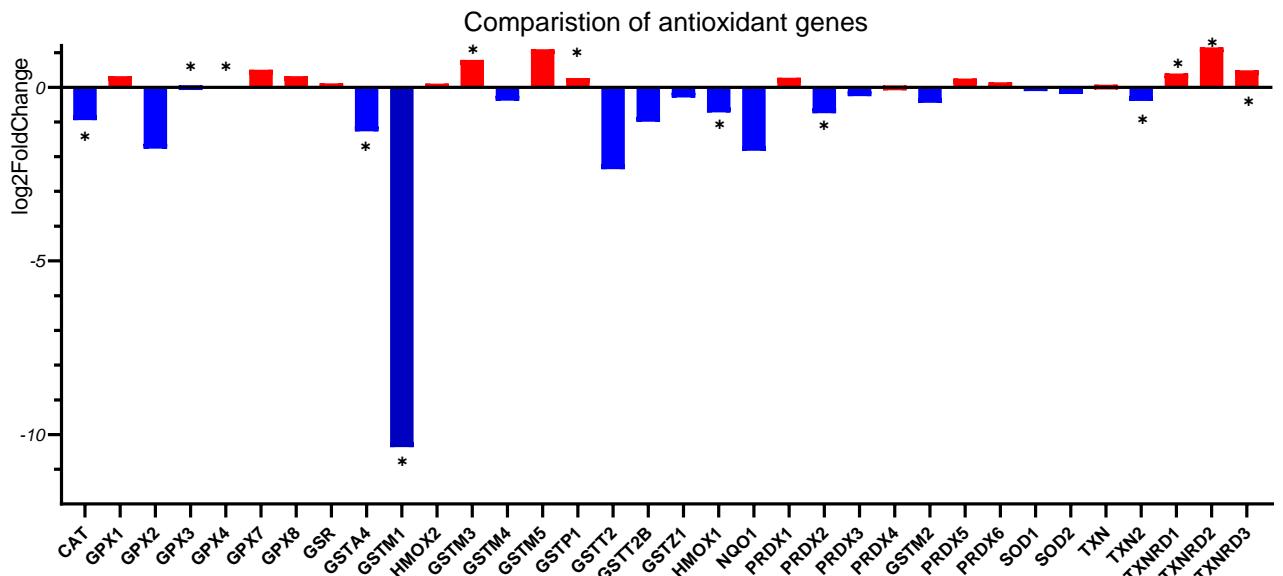

Supplementary Figure 4: Gene expression of the pluripotent, endoderm, mesoderm and ectoderm makers in Alpers' iPSCs.

The numbers of clones and replications in each experiment were listed in Table S 15.

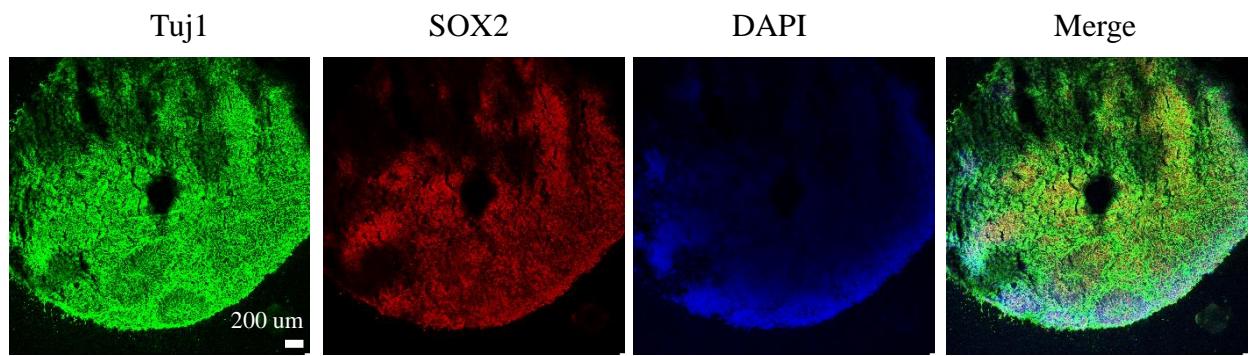

Supplementary Figure 5: Flow cytometric analysis of CIV levels and MTDR in iPSCs, and TFAM expression in NSCs.

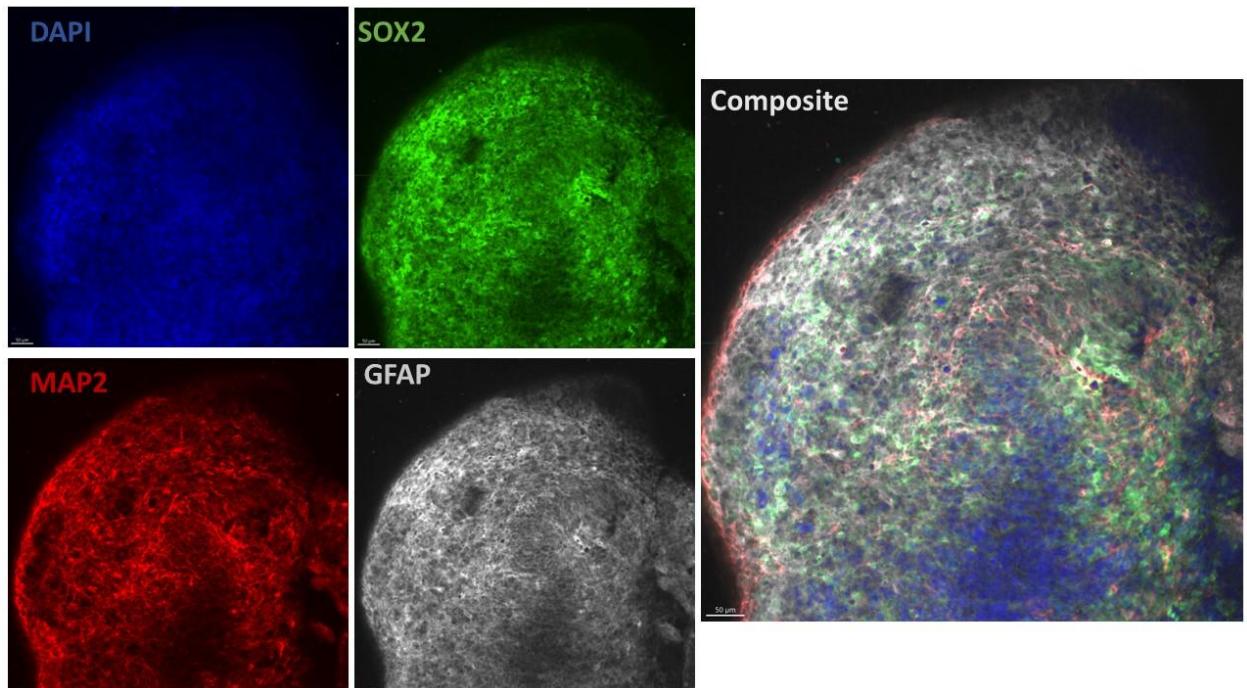

The numbers of clones and replications in each experiment were listed in Table S 15.

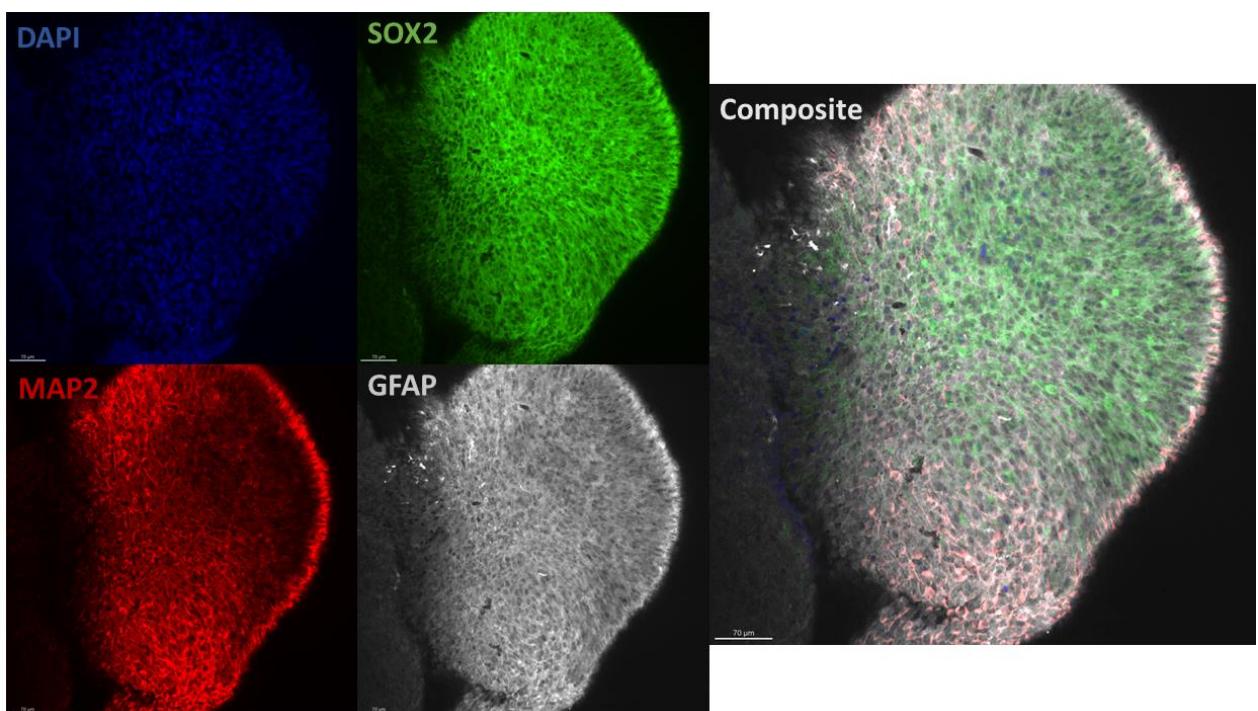

Supplementary Figure 6: The comparison of antioxidant genes (up), anti- and pro-apoptotic genes (down) in Alpers' NSCs comparing to the control NSCs. The vertical axis is labeled as "log2 Fold change," each bar represents the fold change of a gene, with bars above the horizontal axis indicating increased expression (upregulation) and bars below indicating decreased expression (downregulation). The asterisks likely indicate that the change in expression for those genes is statistically significant.

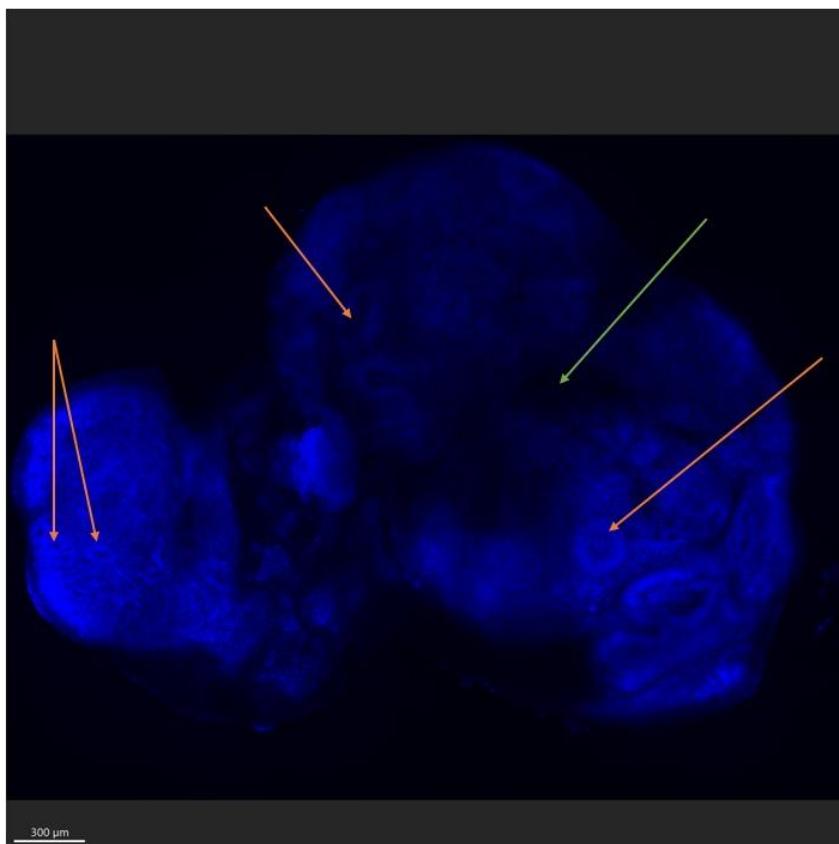

Supplementary Figure 7: Fluorescent staining of cortical organoid section using neuron marker Tuj1 and neural progenitor marker SOX2 at day 40 in control line. Nuclei are stained with DAPI (blue). Scale bar is 200 μm.

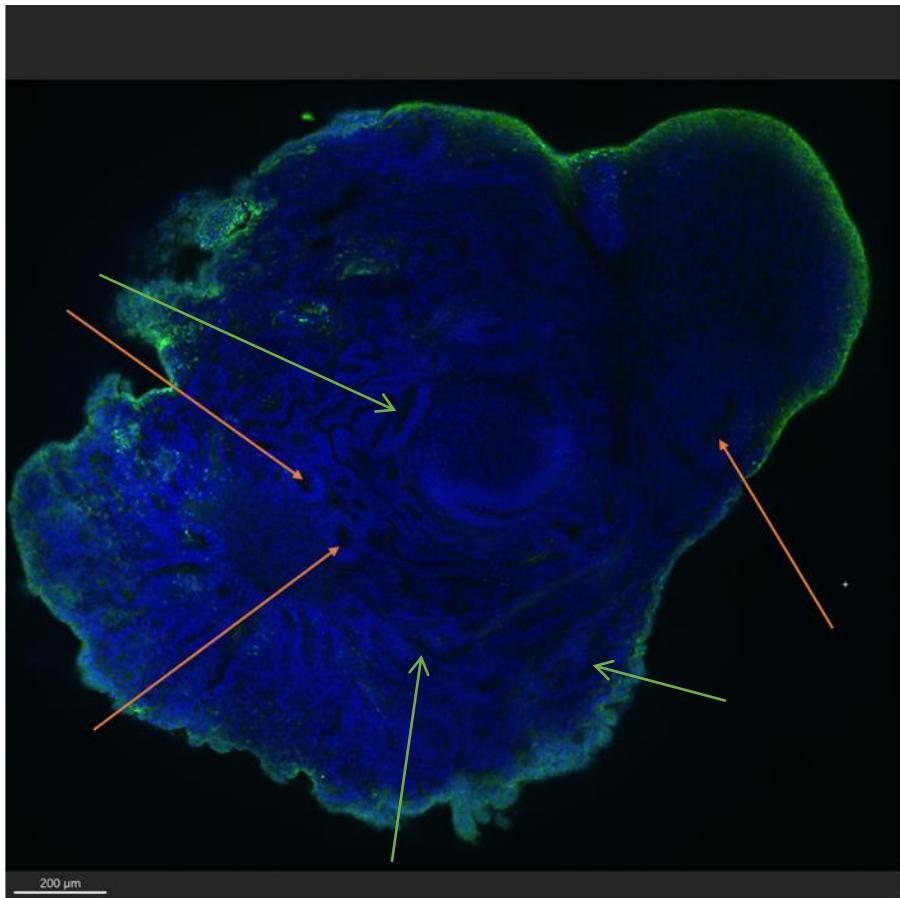

Supplementary Figure 8: Fluorescent staining of cortical organoid section using neuron marker MAP2 (red), astrocyte marker GFAP (white), and neuron progenitor marker SOX2 (green) in Alpers' line (clone 1). Nuclei are stained with DAPI (blue). Scale bar is 50 μ m.

Supplementary Figure 9: Fluorescent staining of cortical organoid section using neuron marker MAP2 (red), astrocyte marker GFAP (white), and neuron progenitor marker SOX2 (green) in Alpers' line (clone 2). Nuclei are stained with DAPI (blue). Scale bar is 70 μ m.

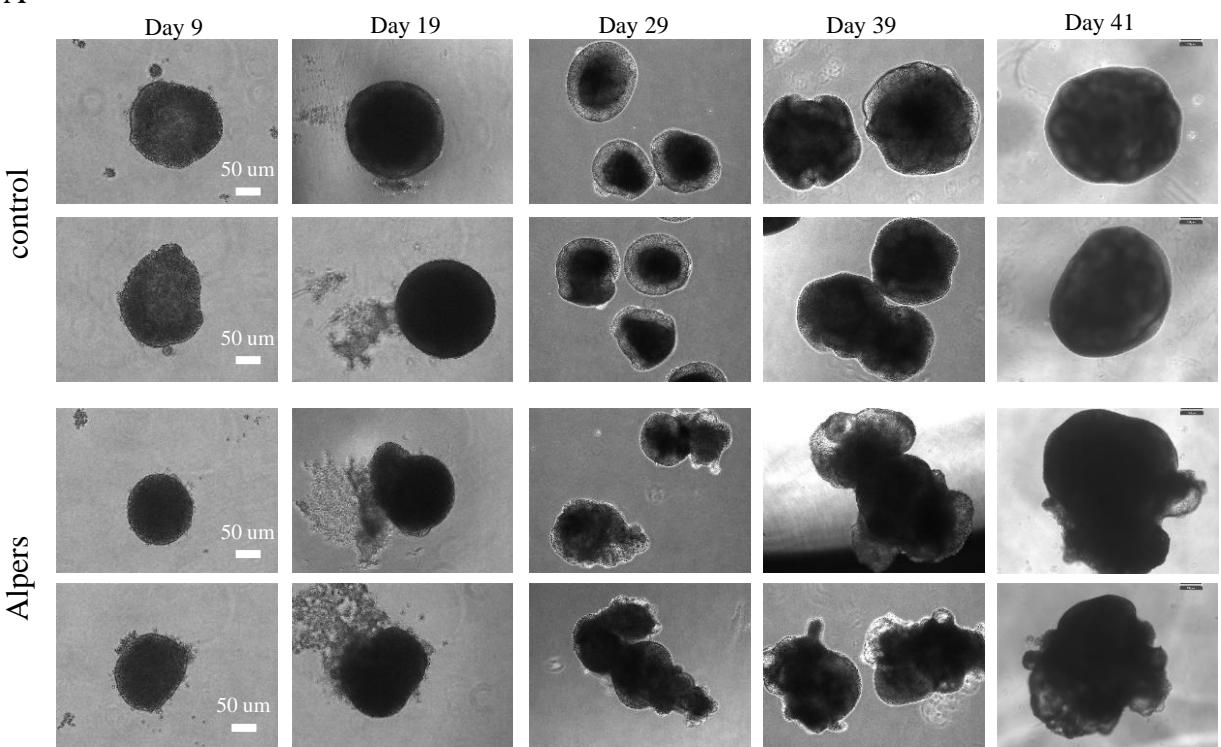

Supplementary Figure 10: Representative image of deep layer of organoid with DAPI stain in Alpers' line (clone 1). Orange arrows point to circular configuration of nuclei reminiscent of neural rosette structures. Green arrow shows area devoid of DAPI assumed to be either apoptotic or left unstained due to limited permeability. Scale bar is 300 μ m.

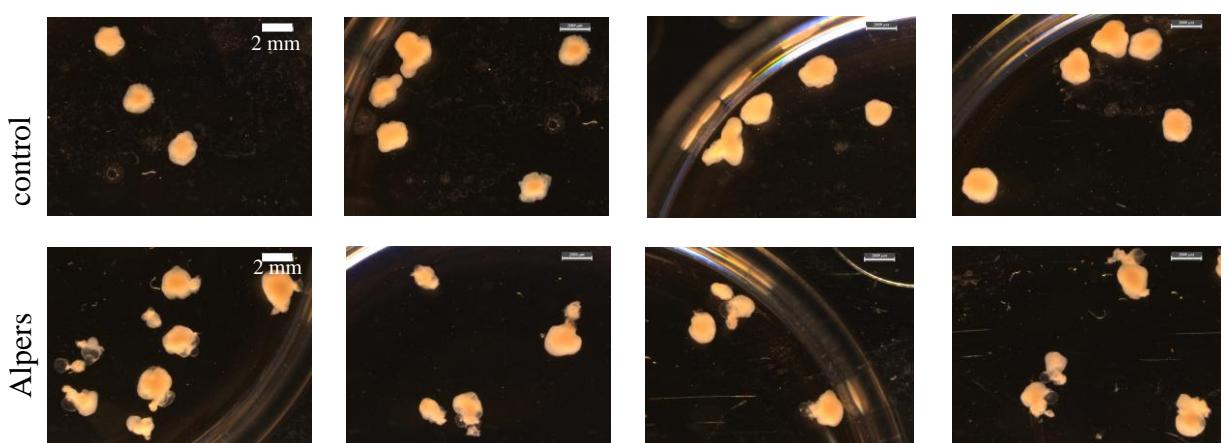

Supplementary Figure 11: Representative image of deep layer of organoid with DAPI stain in Alpers' line (clone 2). Orange arrows point to circular configuration of nuclei reminiscent of neural rosette structures. Green arrow shows area devoid of DAPI assumed to be either apoptotic or left unstained due to limited permeability. Scale bar is 200 μm.

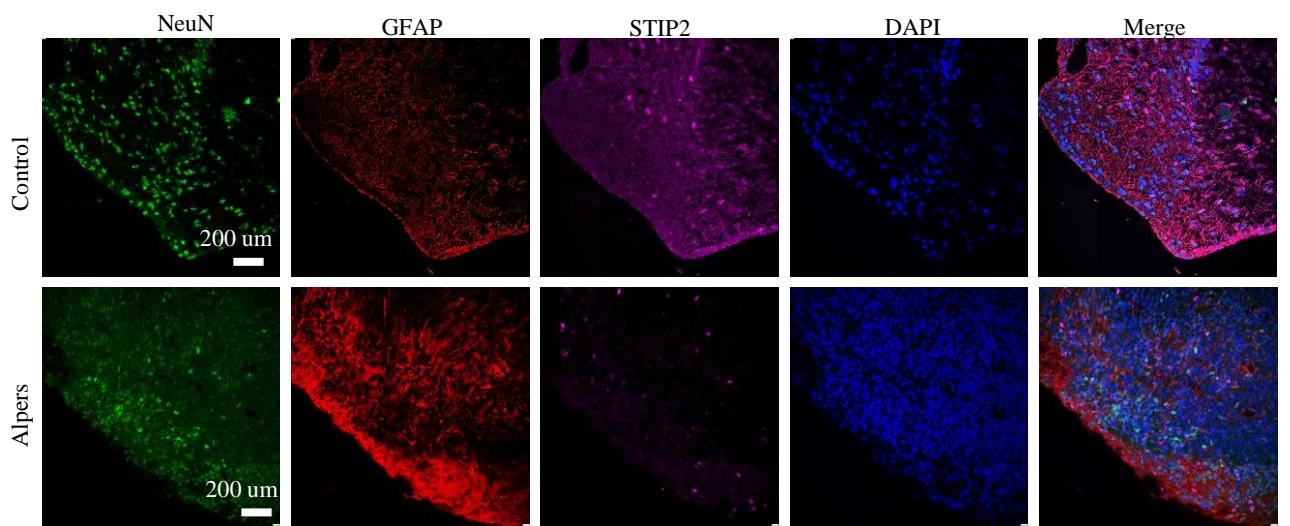

A

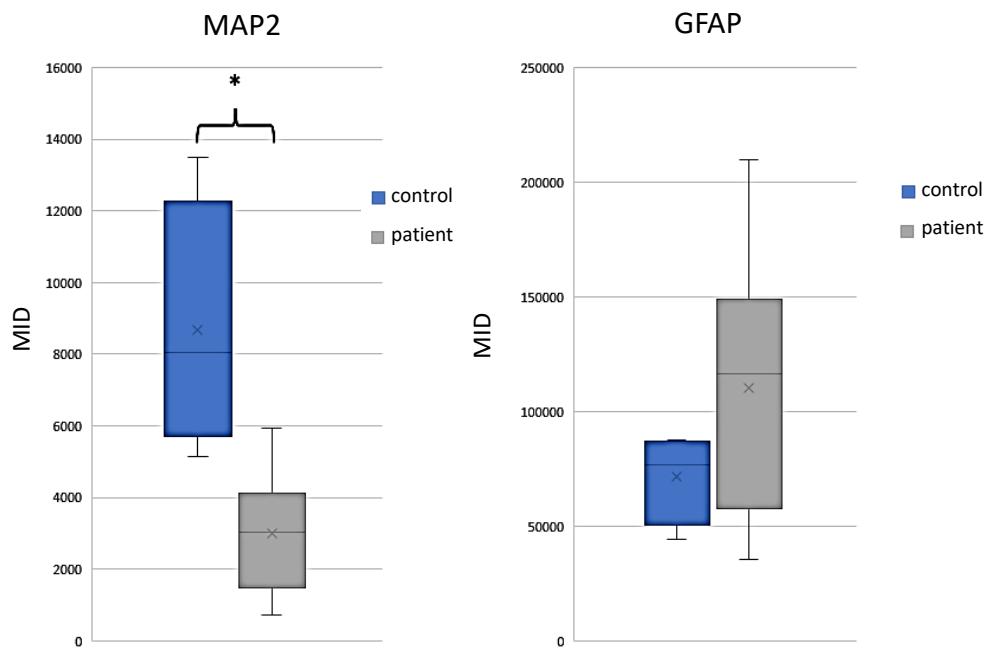

B

Supplementary Figure 12: Phase-contrast images (A) and bright field images (B) of cortical organoids of control and Alpers' patient line during the differentiation (A) and at day 37 (B). Scale bar is 100 μm or 2 mm.

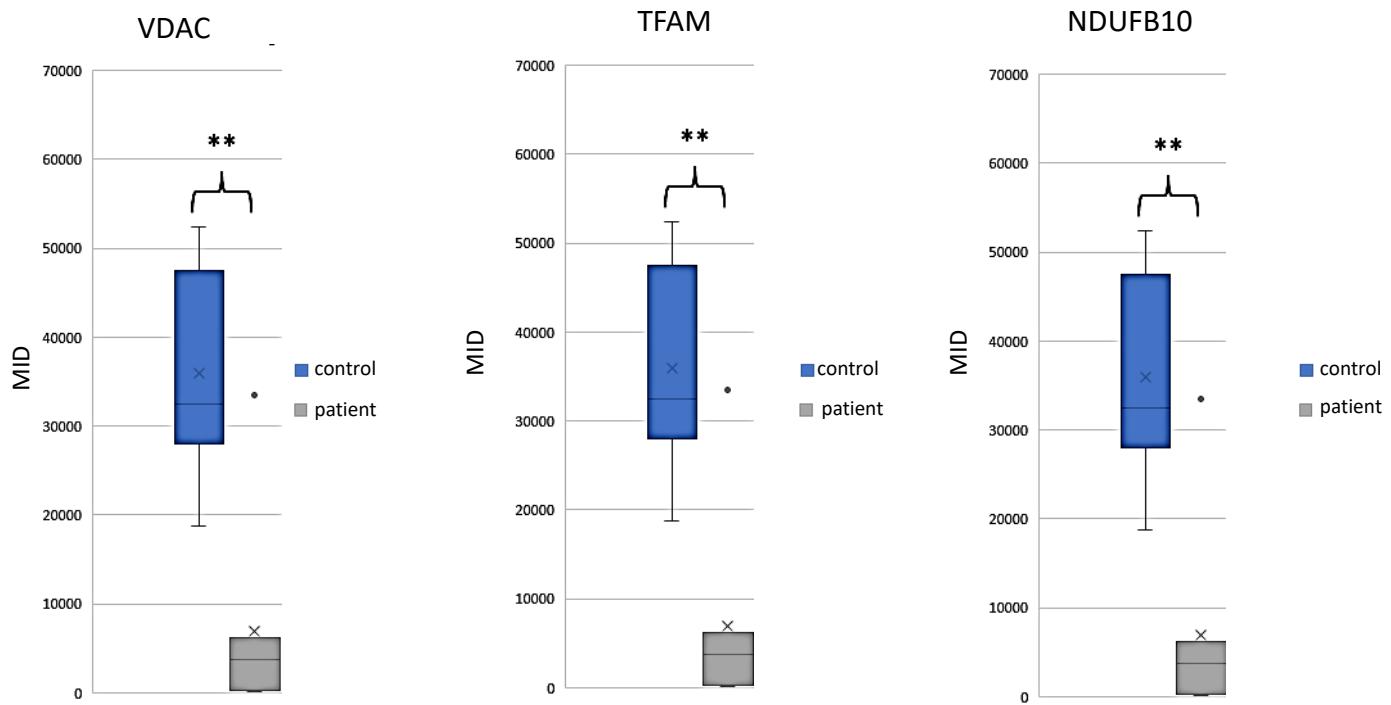

Supplementary Figure 13: Fluorescent staining of cortical organoid section using neuron marker NeuN, astrocyte marker GFAP, and cortical neuron marker MAP2 at day 30 in control and Alpers' line. Nuclei are stained with DAPI (blue). Scale bar is 200 μm.

Supplementary Figure 14: Quantification of the immortalizing showing mean of integrated density (MID) values for marker MAP2, and GFAP. Values are obtained from measuring different regions of an individual organoids of each line. Boxes show median values and upper and lower quartiles. X indicates the mean value. Whiskers show the highest and lowest values. Dots indicate outlier values. Fluorescent analysis was performed in ImageJ using the threshold and measure function. The data was represented as mean +/- SD, n ≥ 4. Significant values ($P \leq .05$) are annotated with (*).

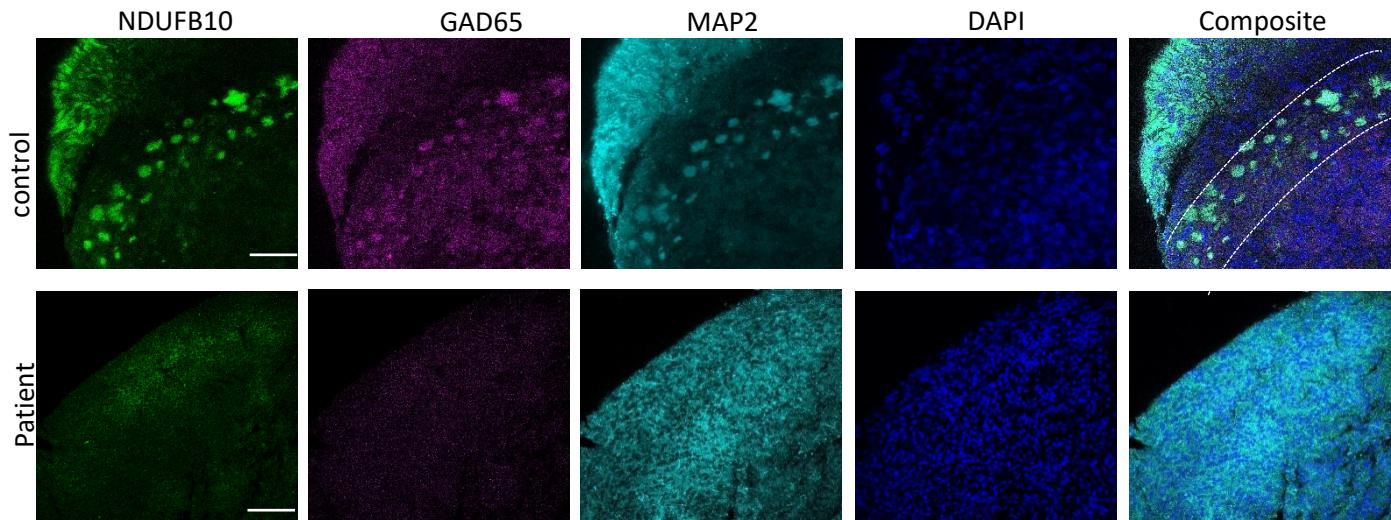

The numbers of clones and replications in each experiment were listed in Table S 15.

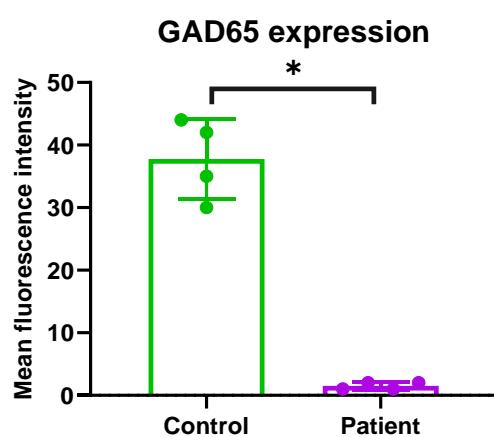

Supplementary Figure 15: Quantification of the immortalizing showing mean of integrated density (MID) values of patient and control cortical organoids for marker VDAC, TFAM and NDUFB10. Values are obtained from measuring different regions of an individual organoid of each line. Boxes show median values and upper and lower quartiles. X indicates the mean value. Whiskers show the highest and lowest values. Dots indicate outlier values. Fluorescent Analysis was performed in ImageJ using the threshold and measure function. The data was represented as mean +/- SD, n ≥ 5. Highly Significant values (P ≤ .01) are annotated with (**).

The numbers of clones and replications in each experiment were listed in Table S 15.

Supplementary Figure 16: Fluorescent staining (A) and quantification of the fluorescent intensity (B) for cortical organoid section using interneuron marker GAD 65 (purple), neuron marker MAP2 (cyan) and complex I subunit NDUFB10 (green) in control and Alpers' line. Nuclei are stained with DAPI (blue). Scale bar is 50 μ m.

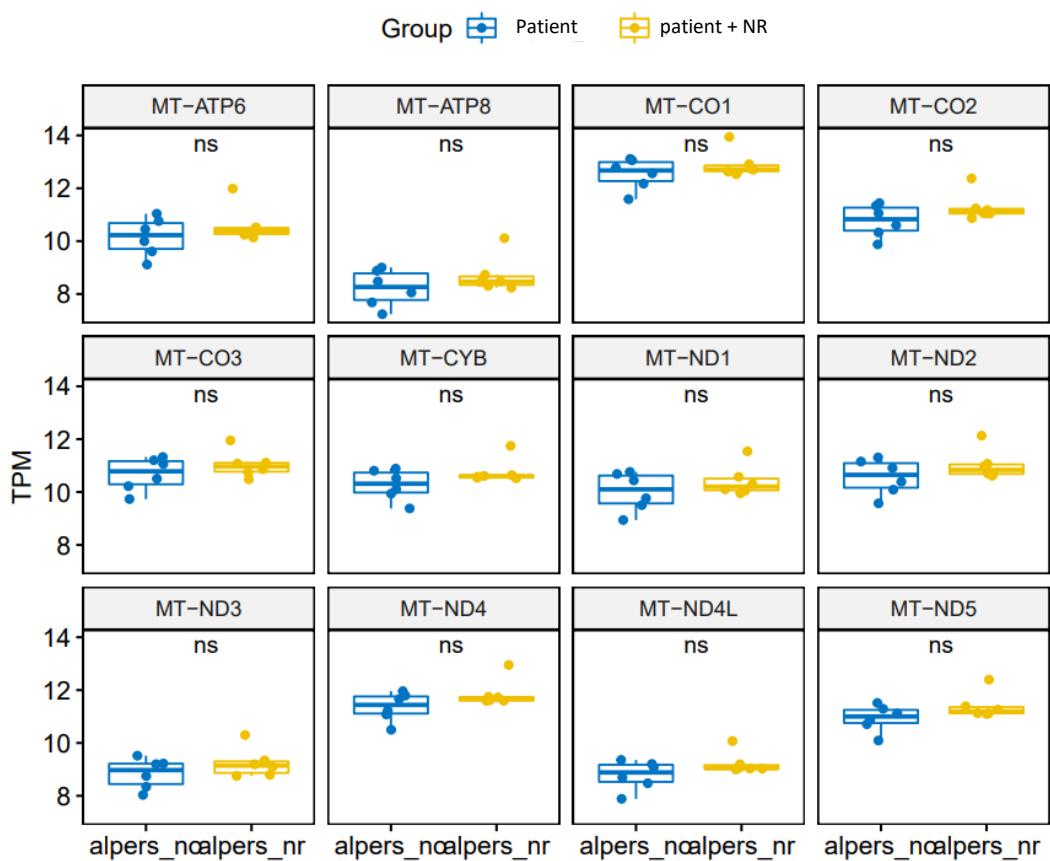

Supplementary Figure 17: Quantification of the fluorescent intensity TFAM and VDAC for control and patient cortical organoid before and after NR treatment. Values are obtained from measuring different regions of an individual organoids of each line. Boxes show median values and upper and lower quartiles. X indicates the mean value. Whiskers show the highest and lowest values. Dots indicate outlier values. Fluorescent Analysis was performed in ImageJ using the threshold and measure function. The data was represented as mean +/- SD, $n \geq 5$. Highly significant differences ($P \leq .01$) are annotated with (**).

The numbers of clones and replications in each experiment were listed in Table S 15.

Supplementary Figure 18: Fluorescent staining of cortical organoid section using interneuron marker GAD 65 (purple), neuron marker MAP2 (cyan) and complex I subunit NDUFB10 (green) in Alpers' line in the presence of NR treatment. Nuclei are stained with DAPI (blue). Scale bar is 50 μ m.

Supplementary Figure 19: RNA expressions of mitochondrial genes in Alpers' organoids before and after NR treatment.
