

Supplementary Figure S1

(A) Representative IF images and bright images of CCA PDC cells stained with CK19 and DAPI. Scale bar, 50 μm . (B) The half-maximal inhibitory concentration (IC50) values for decitabine and azacitidine are represented on the y axis in commercial CCA cell lines from drug response data (Supawan Jamnongsong et al).

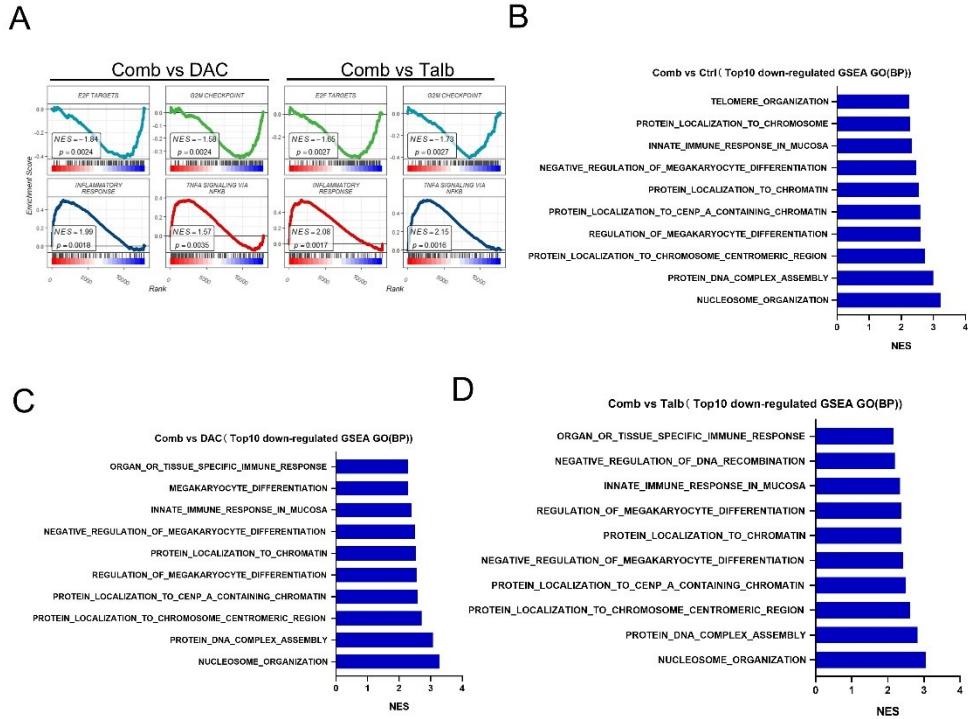

Supplementary Figure S2

(A) Drug combination index (CI) between decitabine and talazoparib in QBC939 and TFK-1 cells based on 96h cell survival assay. CI values were assessed with CalcuSyn software ($CI < 1$, synergism; $CI = 1$, additive; $CI > 1$, antagonism). (B) Representative images of colony formation assay in QBC939 and TFK-1 cells treated with vehicle, decitabine, talazoparib or their combination. (C) Colony formation assay of EGI-1 parental (P) and resistant (R) cells treated with vehicle and gemcitabine. (D) CI of decitabine and talazoparib in EGI-1 R cells based on 96 h cell survival assay. (E) Colony formation assay of EGI-1 R treated with vehicle, decitabine, talazoparib or their combination. (F) Relative proliferation assay of CCA PDO treated with vehicle, decitabine, talazoparib or their combination. The relative proliferation was determined using CCK8 assays. The synergy score was calculated as the deviation from the theoretical inhibition calculated by the Bliss method. Here, a synergy score of $\pm 10\%$ indicates an additive interaction, below -10% an antagonistic interaction, and above 10% synergy.

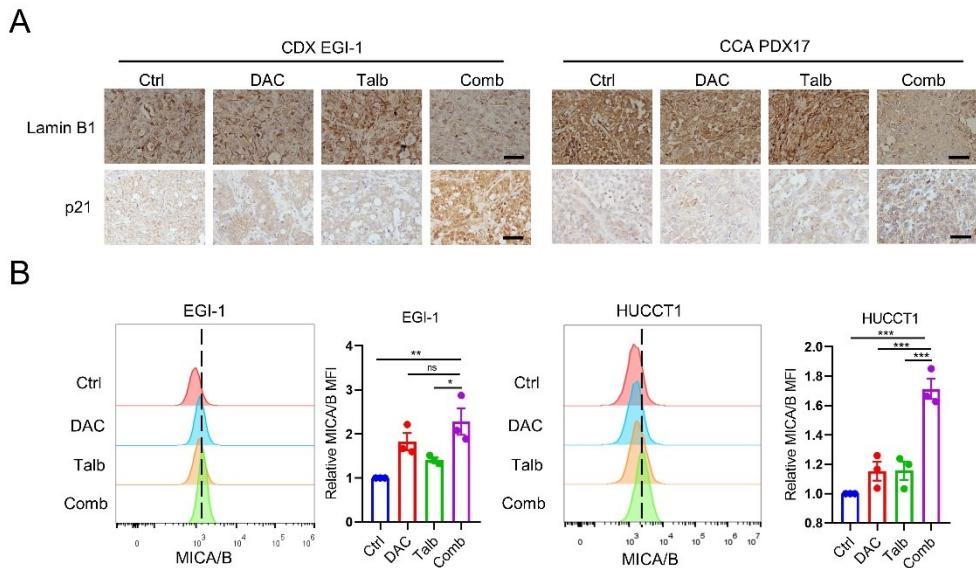

Supplementary Figure S3

(A and B) Mice weight of indicated group during the period of treatment

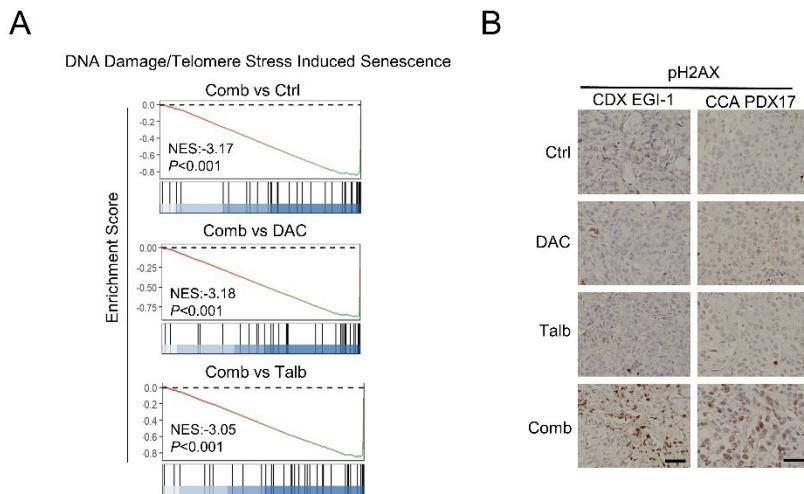

Supplementary Figure S4

(A) GSEA analysis of Hallmark pathway from EGI-1 cells treated with combined therapy compared with single drug treatments. (B-D) Normalized enrichment score (NES) graph of the top 10 down-regulated GSEA gene ontology (GO) Biological Process (BP) pathways of EGI-1 cell lines treated with combined therapy compared with control(B), decitabine(C) and talazoparib(D).

Supplementary Figure S5

(A) Representative images of Lamin B1 and p21 staining were performed on formalin-fixed, paraffin-embedded PDXs and CDXs after the last dose of vehicle, decitabine, talazoparib, or the combination treatment. Scale bar, 50 μ m. (B) MICA/B expression in EGI-1 and HUCCT1 cells after decitabine, talazoparib, or the combination treatment.

Supplementary Figure S6

(A) GSEA analysis of Reactome pathway from EGI-1 cells treated with combined therapy compared with vehicle showed that the indicated pathway was significantly enriched. NES, normalized enrichment score. (B) Representative images of pH2AX staining were performed on formalin-fixed, paraffin-embedded PDXs and CDXs after the last dose of vehicle, decitabine, talazoparib or the combination treatment. Scale bar, 50 μ m.

Supplementary Table S1. Characteristics of Patients

patient ID	gender	age	Clinical Characteristics	Immunohistochemistry
CCA17/PD X 17	male	64	cholangiocarcinoma	CK(AE1/AE3) (+), CK7 (+), CEA (+), CDX2 (-), CK20 (-); #2D:CK7 (+), Muc-1 (+), Muc- 5AC (-), CK20 (-), CDX2 (-), Muc-2 (-), SATB2 (weak +), HepPar-1(-), TTF-1 (-), PSA (-). in situ hybridization results: EBERs (-).
CCA21	male	70	cholangiocarcinoma	CK7 (+), CK19 (+), Muc-1(+), Muc-2 (-), CDX2 (-), HepPar- 1(-), AFP (-), Arginase-1(-); in situ hybridization Arginase - 1 results: EBERs (-).
CCA60	female	65	cholangiocarcinoma	HepPar-1(-), AFP (Minor positivity), Arginase-1(-), Glypican-3(-), CK7(+), CK19(+), CD34(-), CD10(+), Muc-5AC (-).
CCA55	male	61	cholangiocarcinoma	HepPar-1(-), AFP (-), Arginase- 1(-), Glypican-3(-), CK7(+), CK19(+), CD34(-), CD10(+).

Supplementary Table S2. Drug screening results

Index	Molname	C/S score
1	Talazoparib	0.580938
